

Introduction

- Example: model train controller.

© 2000 Morgan
Kaufman

Overheads for *Computers as
Components 2nd ed.*

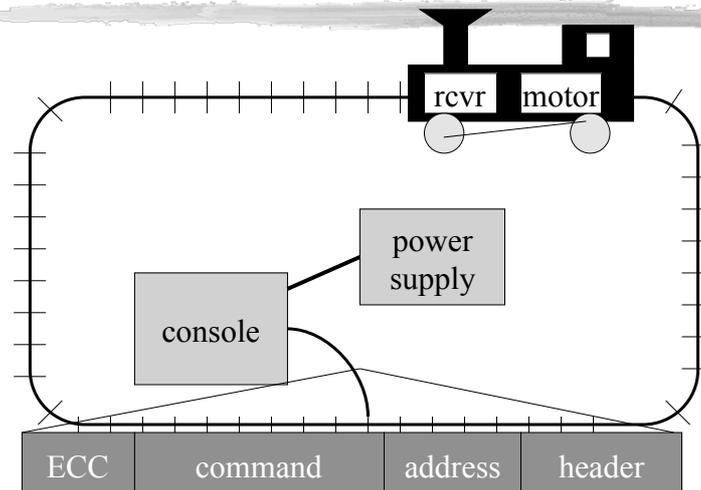

Purposes of example

- Follow a design through several levels of abstraction.
- Gain experience with UML.

© 2008 Wayne Wolf

Model train setup

© 2008 Wayne Wolf

Overheads for *Computers as
Components 2nd ed.*

Requirements

- Console can control 8 trains on 1 track.
- Throttle has at least 63 levels.
- Inertia control adjusts responsiveness with at least 8 levels.
- Emergency stop button.
- Error detection scheme on messages.

© 2008 Wayne Wolf

Overheads for *Computers as
Components 2nd ed.*

Requirements form

name	model train controller
purpose	control speed of ≤ 8 model trains
inputs	throttle, inertia, emergency stop, train #
outputs	train control signals
functions	set engine speed w. inertia; emergency stop
performance	can update train speed at least 10 times/sec
manufacturing cost	\$50
power	wall powered
physical size/weight	console comfortable for 2 hands; < 2 lbs.

Digital Command Control

- DCC created by model railroad hobbyists, picked up by industry.
- Defines way in which model trains, controllers communicate.
 - Leaves many system design aspects open, allowing competition.
- This is a simple example of a big trend:
 - Cell phones, digital TV rely on standards.

© 2008 Wayne Wolf

Overheads for *Computers as
Components 2nd ed.*

DCC documents

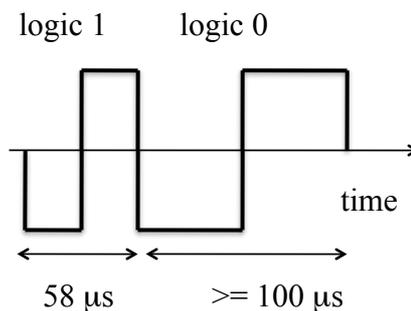

- Standard S-9.1, DCC Electrical Standard.
 - Defines how bits are encoded on the rails.
- Standard S-9.2, DCC Communication Standard.
 - Defines packet format and semantics.

© 2008 Wayne Wolf

Overheads for *Computers as Components*, 2nd ed.

DCC electrical standard

- Voltage moves around the power supply voltage; adds no DC component.
- 1 is 58 μ s, 0 is at least 100 μ s.

© 2008 Wayne Wolf

Overheads for *Computers as Components* 2nd ed.

DCC communication standard

- Basic packet format: PSA(sD)+E.
- P: preamble = 111111111.
- S: packet start bit = 0.
- A: address data byte.
- s: data byte start bit.
- D: data byte (data payload).
- E: packet end bit = 1.

© 2000 Morgan
Kaufman

Overheads for *Computers as
Components*

DCC packet types

- Baseline packet: minimum packet that must be accepted by all DCC implementations.
 - Address data byte gives receiver address.
 - Instruction data byte gives basic instruction.
 - Error correction data byte gives ECC.

Components, 2nd ed.*

Conceptual specification

- Before we create a detailed specification, we will make an initial, simplified specification.
 - Gives us practice in specification and UML.
 - Good idea in general to identify potential problems before investing too much effort in detail.

Components 2nd ed.*

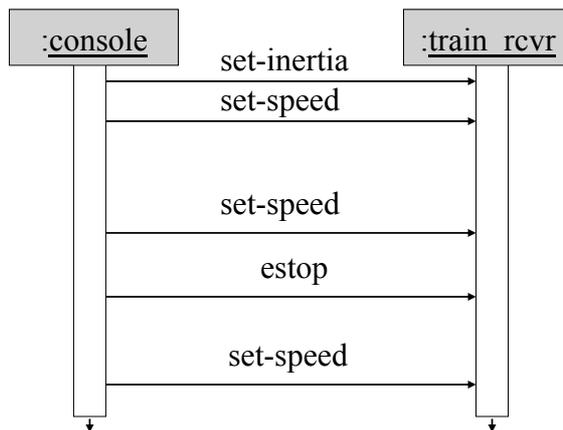

Basic system commands

command name	parameters
set-speed	speed (positive/negative)
set-inertia	inertia-value (non- negative)
estop	none

Message classes

© 2008 Wayne Wolf

Overheads for *Computers as Components 2nd ed.*

Roles of message classes

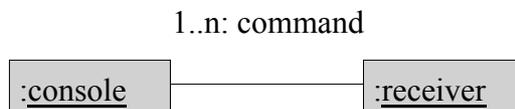

- Implemented message classes derived from message class.
 - ┆ Attributes and operations will be filled in for detailed specification.
- Implemented message classes specify message type by their class.
 - ┆ May have to add type as parameter to data structure in implementation.

Components 2nd ed.*

System structure modeling

- Some classes define non-computer components.
 - ┆ Denote by *name.
- Choose important systems at this point to show basic relationships.

© 2008 Wayne Wolf

Overheads for *Computers as
Components 2nd ed.*

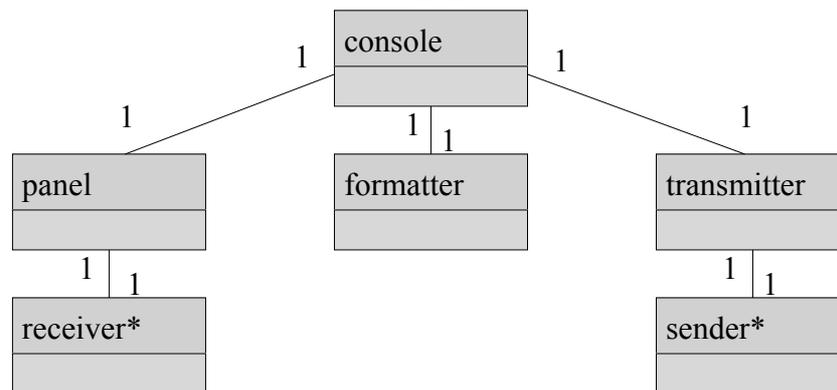

Major subsystem roles

- Console:
 - ┆ read state of front panel;
 - ┆ format messages;
 - ┆ transmit messages.
- Train:
 - ┆ receive message;
 - ┆ interpret message;
 - ┆ control the train.

Components 2nd ed.*

Console system classes

© 2008 Wayne Wolf

Overheads for *Computers as
Components 2nd ed.*

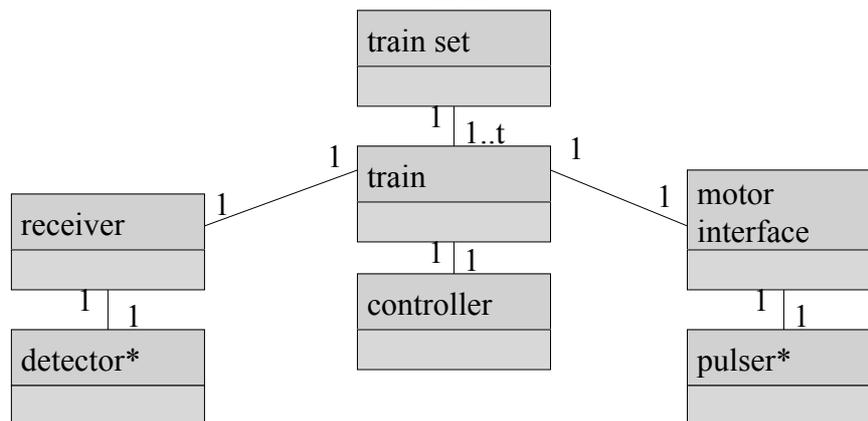

Console class roles

- panel: describes analog knobs and interface hardware.
- formatter: turns knob settings into bit streams.
- transmitter: sends data on track.

© 2008 Wayne Wolf

Overheads for *Computers as
Components 2nd ed.*

Train system classes

© 2008 Wayne Wolf

Overheads for *Computers as
Components 2nd ed.*

Train class roles

- receiver: digitizes signal from track.
- controller: interprets received commands and makes control decisions.
- motor interface: generates signals required by motor.

Components 2nd ed.*

Detailed specification

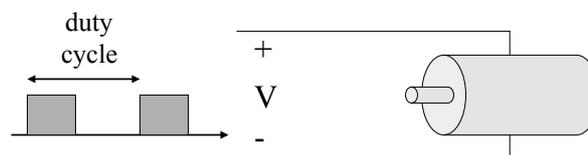

- We can now fill in the details of the conceptual specification:
 - more classes;
 - behaviors.
- Sketching out the spec first helps us understand the basic relationships in the system.

Components 2nd ed.*

Train speed control

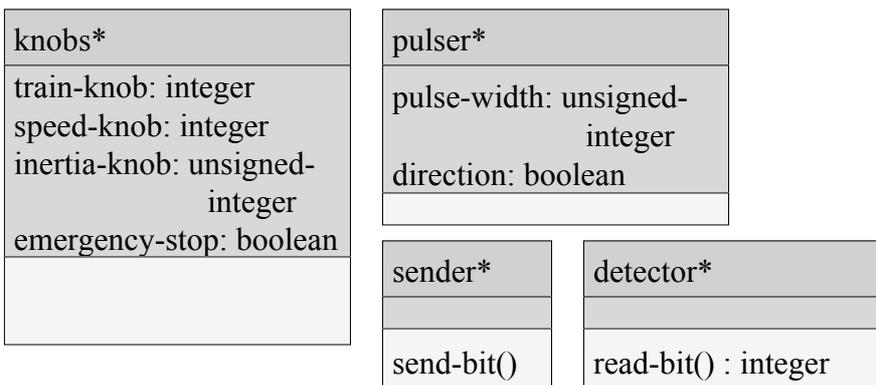

- Motor controlled by pulse width modulation:

Components 2nd ed.*

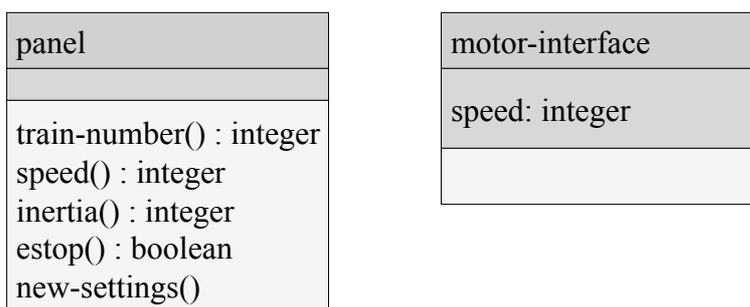

Console physical object classes

© 2008 Wayne Wolf

Overheads for *Computers as Components 2nd ed.*

Panel and motor interface classes

© 2008 Wayne Wolf

Overheads for *Computers as Components 2nd ed.*

Class descriptions

- panel class defines the controls.
 - new-settings() behavior reads the controls.
- motor-interface class defines the motor speed held as state.

© 2008 Wayne Wolf

Overheads for *Computers as Components 2nd ed.*

Transmitter and receiver classes

transmitter	receiver
send-speed(adrs: integer, speed: integer) send-inertia(adrs: integer, val: integer) set-estop(adrs: integer)	current: command new: boolean read-cmd() new-cmd() : boolean rcv-type(msg-type: command) rcv-speed(val: integer) rcv-inertia(val:integer)

© 2008 Wayne Wolf

Overheads for *Computers as Components 2nd ed.*

Class descriptions

- transmitter class has one behavior for each type of message sent.
- receiver function provides methods to:
 - detect a new message;
 - determine its type;
 - read its parameters (estop has no parameters).

© 2008 Wayne Wolf

Overheads for *Computers as
Components 2nd ed.*

Formatter class

formatter
current-train: integer current-speed[ntrains]: integer current-inertia[ntrains]: unsigned-integer current-estop[ntrains]: boolean
send-command() panel-active() : boolean operate()

© 2008 Wayne Wolf

Overheads for *Computers as
Components 2nd ed.*

Formatter class description

- Formatter class holds state for each train, setting for current train.
- The operate() operation performs the basic formatting task.

© 2008 Wayne Wolf

Overheads for *Computers as Components 2nd ed.*

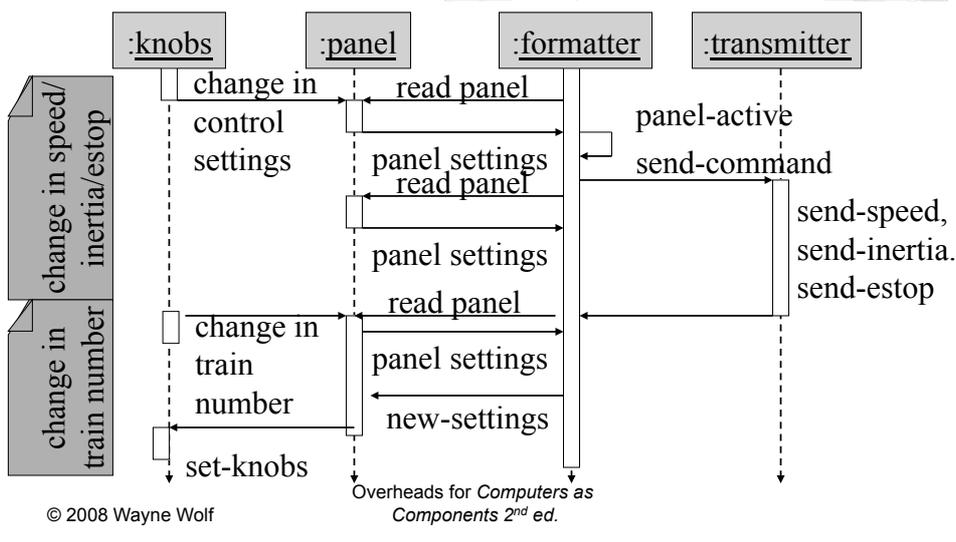

Control input cases

- Use a soft panel to show current panel settings for each train.
- Changing train number:
 - must change soft panel settings to reflect current train's speed, etc.
- Controlling throttle/inertia/estop:
 - read panel, check for changes, perform command.

Controller class

controller
current-train: integer current-speed[ntrains]: integer current-direction[ntrains]: boolean current-inertia[ntrains]: unsigned-integer
operate() issue-command()

© 2008 Wayne Wolf

Overheads for *Computers as
Components 2nd ed.*

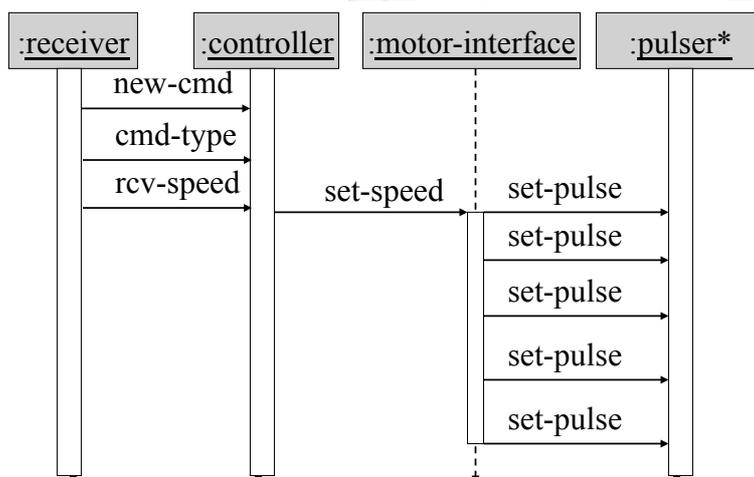

Setting the speed

- Don't want to change speed instantaneously.
- Controller should change speed gradually by sending several commands.

Summary

- Separate specification and programming.
 - Small mistakes are easier to fix in the spec.
 - Big mistakes in programming cost a lot of time.
- You can't completely separate specification and architecture.
 - Make a few tasteful assumptions.
