Unit OS3: Concurrency

3.1. Concurrency, Critical Sections, Semaphores

Windows Operating System Internals - by David A. Solomon and Mark E. Russinovich with Andreas Polz

Roadmap for Section 3.1.

- The Critical-Section Problem
- Software Solutions
- Synchronization Hardware
- Semaphores
- Synchronization in Windows & Linux

Bakery Algorithm (Lamport 1979)

A Solution to the Critical Section problem for n threads

- Before entering its critical section, a thread receives a number. Holder of the smallest number enters the critical section.
- If threads T_i and T_j receive the same number, if i < j, then T_i is served first; else T_i is served first.
- The numbering scheme generates numbers in monotonically non-decreasing order; i.e., 1,1,1,2,3,3,3,4,4,5...

Bakery Algorithm

Linux Synchronization

- Kernel disables interrupts for synchronizing access to global data on uniprocessor systems.
- Uses *spinlocks* for multiprocessor synchronization.
- Uses *semaphores* and *readers-writers* locks when longer sections of code need access to data.
- Implements POSIX synchronization primitives to support multitasking, multithreading (including real-time threads), and multiprocessing.
