

# Rechnerarchitektur des NXT

Holger Just

Prozesssteuerung und Robotik

# Agenda

- Overview
- Micro Processors
- Sensors
- Actuators
- I<sup>2</sup>C

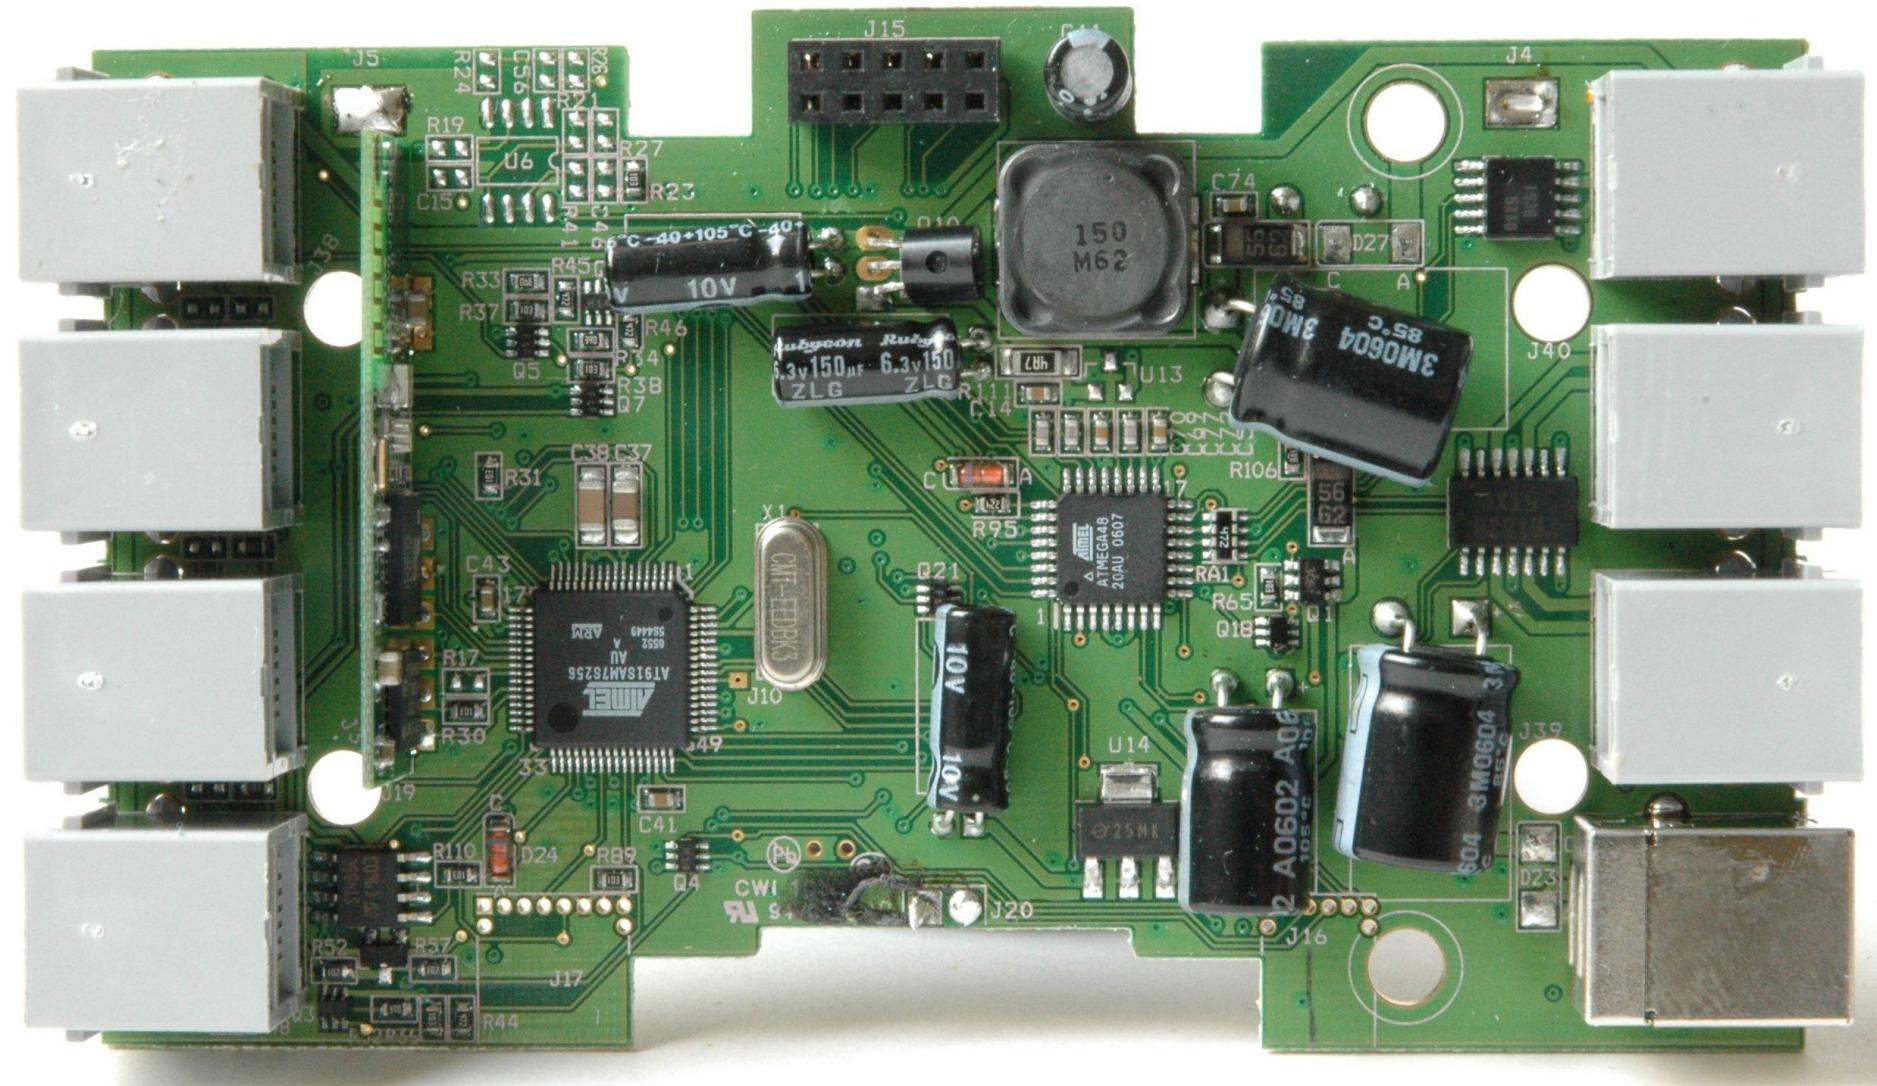

# Central Micro Processors

	Atmel ARM7 main processor	Atmel ATmega48 co-processor
<b>System Architecture</b>	ARM – 32-bit RISC	AVR – 8-bit RISC
<b>RAM</b>	64 kilobytes	512 bytes
<b>Flash RAM</b>	256 kilobytes	4 kilobytes + 256 byte EEPROM
<b>Throughput</b>	Up to 49.5 MIPS (@ 55 MHz)	Up to 20 MIPS (@ 20 MHz)
<b>Purpose</b>	Running programs; communication via Bluetooth, USB; checking sensors; sound generation	Connects the motors and buttons

# PCB (1)

# Atmel AT91SAM7S256

## Interrupt Controller

- 8 Level Priority, individually maskable

## Real-time Timer

- 32 Bit free running timer
- Programmable counter + interval counter

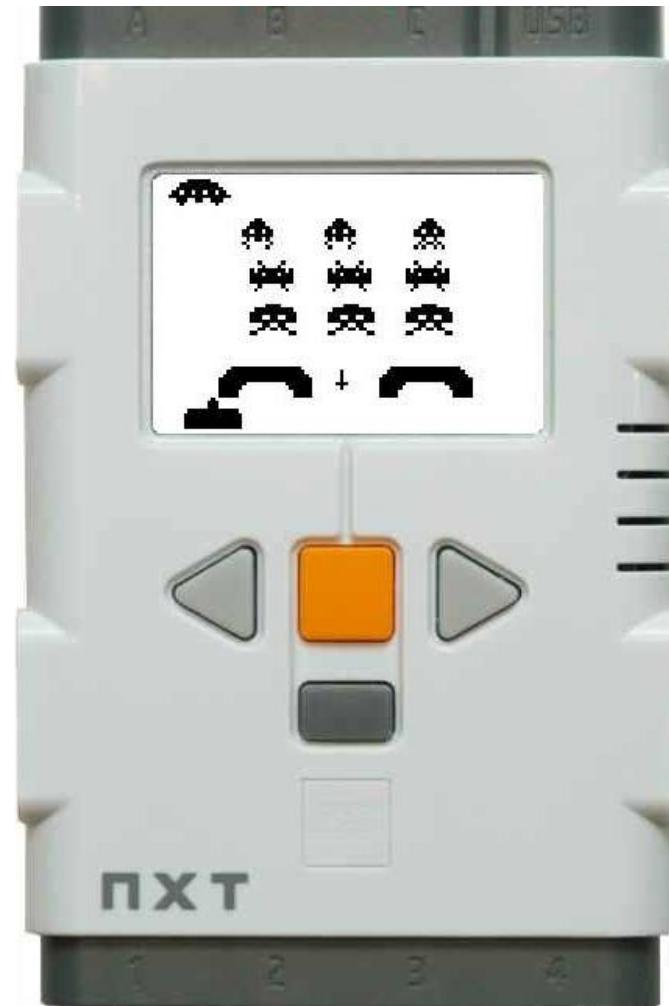

## I/O

- USB 2.0 Interface
- 32 programmable I/O lines
- 8-channel ADC
- Serial Peripheral Interface (for display and sensors)
- JTAG Interface (for debugging)

Layed out on PCB,  
but not used

# Display

- 100 x 64 Pixel monochrome LCD display
- Each pixel individually addressable
- Even allows space invaders to be played on NXT

# Sound

- Simple tone generation using sine-wave tones
- Also plays standard PCM files
  - Mono, 8 bit, 2kHz – 16kHz sampling frequency
  - Decoded using the ARM7

# Communication

- USB 2.0 Full-Speed (12 Mbit/s)
  - Included in ARM7 CPU
- Bluetooth 2.0 +EDR using Serial Port Profile
  - Class II – ca. 10 meters range
  - External controller connected to ARM7

# Motors

- New motor specifically for the NXT

Weight	80 g
Stalled torque	50 Ncm
Stalled current	2 A
Rotation speed (free running)	170 rpm
No-load current	60 mA

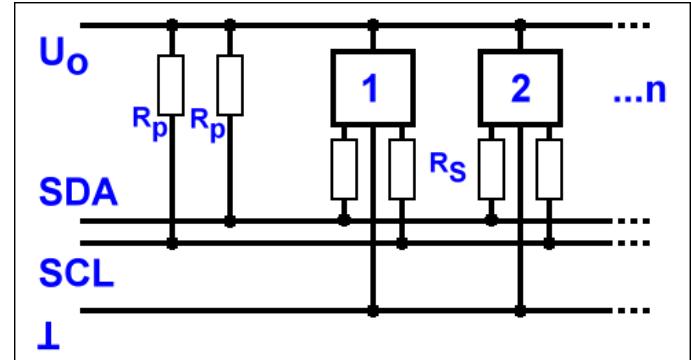

Overheats  
the motor  
after a few  
secs

- Built-in optical rotation sensor (1 degree resolution)
  - Allows to synchronize motors in pairs
- Each NXT brick can control up to 3 individual motors

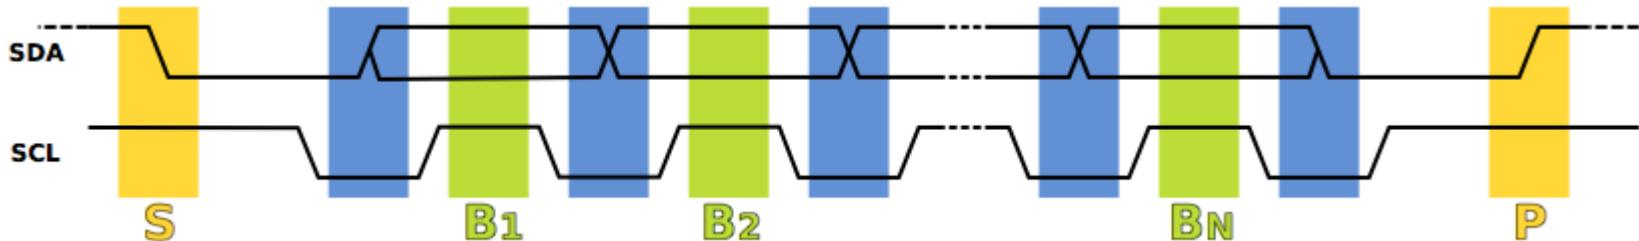

# Standard NXT Sensors

- Touch sensor – Measures linear pressure against the sensor
- Sound sensor – Measures acoustic pressure in selectable frequency ranges
- Light sensor – Measures the amount of light reflected by nearby objects
- Ultrasonic sensor – Measures the distance to nearby objects using high frequency sound waves  
– Uses the I<sup>2</sup>C protocol (low-speed mode)

# I<sup>2</sup>C (4)

- Simple and cheap (multi-)master serial bus
- Allows a single controller to access a whole network of other controllers
- 7-bit address space (max. 112 nodes)
- Master sets clock and addresses slaves

# I<sup>2</sup>C by NXT

- NXT uses the low-speed mode only (10 kbit/s)
- Brick's CPU only supports master mode
- Main use case: additional sensors
  - Sensors not provided by Lego
    - Air Pressure,
    - Compass, ...
  - Allows more than 4 sensors per Brick

# Conclusion

- Common ARM processor
  - Powerful enough for most usage scenarios
- Communicative hardware
  - 4 sensors (and many more using I<sup>2</sup>C)
  - 3 actuators
  - B&W display, sound
  - Bluetooth, USB
